

A Short Guide to Coffee Brewing Methods

Pour-Over

Pour-over is a manual brewing method where hot water is poured over coffee grounds held in a paper filter. It typically uses a medium grind and produces a clean, light-bodied cup.

French Press

French press is an immersion method: coarsely ground coffee steeps directly in hot water, then a metal mesh plunger separates the grounds from the liquid. It produces a fuller, heavier-bodied cup than pour-over.

Espresso

Espresso forces hot water through finely ground, tightly packed coffee under high pressure. It produces a small, concentrated shot that is the base for drinks like lattes and cappuccinos.
